HTA Tester Battery Replacement

Dear Valued Customers and Distributors,

Liquip wishes to advise customers of a minor update affecting our overfill protection system testers (HTA series).

The HTA series are portable testers for truck and gantry 2-wire and 5-wire overfill protection systems. These testers enable testing of truck systems, gantry systems and individual probes for quick and effective fault diagnosis.

Recently, production for LIQ5049 (12VDC dry cell batteries) has ceased. This battery is used in the HTA204 and HTA503 handheld testing units. However, to assist customers when replacing batteries Liquip has sourced an alternative to provide testers with a suitable power supply.

This alternative is being offered under the same part number LIQ5049 and securely combines 2x 6VDC batteries with a wiring harness. This alternative offering has been verified to provide suitable power and to use in the abovementioned HTA units.

Please refer to the HTA series datasheet for technical information.

The price and part number of the current LIQ5049 offering will remain in line with the previous 12VDC offering and will be subject to Liquip pricing policies.

If you have any questions or would like to conduct an on-site survey please contact your local Liquip representative.

Kind Regards,

Liquip Sales team
